

## **(50) Future steps**

### **Compliance rating - „Digitalization of Democracy“:**

There are huge potential benefits for organizations by partly or completely adapting the solution.

We plan a future compliance rating solution „Digitalization of Democracy“ to offer as a service to assess the compliance and track it (fee based).

E.g. an HOA that has a high compliance rating does not violate the home owners' rights and is also offers a high level of transparency therefore much more attractive for future home owners in the HOA. The same with companies, towns, etc..

How compliance can be measured?

- number, type and severity of individual requests/claims (Veto)
- Organizational Self-Check
- External Compliance Service: that is the planned future service „Digitalization of Democracy“

Benefits for potentially impacted organizations:

- the framework implies also a compliance framework. By accepting/committing himself to it the organization can assess and raise its compliance in every relevant point or in some points based on the will and on the possibilities
- speeds-up establishing potential cooperations between organizations nationally and internationally
  - common ground for the minimum service level for owners implies similar processes in different organizations, that enables much faster and easier communication and cooperation
- it makes possible the cooperation of contra dictional organizations. The controlling framework offers a common platform where the organizations can easily complement each other

- e.g. opposing political parties can suddenly cooperate (e.g. a right-wing party wants to raise compliance involving three rights, the left-wing wants to raise compliance involving two other rights)

Summarized: the planned compliance rating solutions enables the rated organizations a continuous raise of level of compliance that results in higher owner satisfaction, more transparency, less fraud, less violations and more efficient economically.

### **future updates:**

It is planned once a year to make an update. The updates should not extent content, but should make the understanding and usage more user-friendly, eventually deliver translations to make the usage by non-English speakers possible.
